### **Alternate Sources of Energy and Energy Conservation Measures**

The institution makes effort for energy conservation by reducing the consumption of energy. Energy conservation is a practice of reducing the quantity of energy used. Conservation of energy has been done by various methods.

- Installing LED bulbs and tube light to reduce the amount of energy required to attain the same level of illumination compared to using traditional incandescent light bulbs.
- Designing features of the building that maximizes the use of natural light. Natural sunlight will create a more relaxed learning environment.
- Switching over to LED's or CFL's can save lot of energy. CFL's last longer than standard incandescent bulbs and cost of fraction of the price to run. Modern LED bulbs can offer a powerful option for lighting at a fraction of the electrical cost.
- Planting trees all around the campus so that there is a less usage of air conditioners. Imparting education about how to reduce electricity at Institutes many students will proudly contribute to the efforts to make their campus a little greener.
- Students are motivated to use light efficiently and switch off the light and fan when they leave the classrooms. Students are also asked to switch off lights when there is sufficient sun light. Unplugging projectors, televisions, computers and smart boards after the use.
